

ABSTRACT OF THE DISCLOSURE

A method, system, apparatus and data structure is described wherein two or more different systems producing electronic data relating to a transaction involving

5 documentation communicated in an electronic form. Copies of the electronic data are processed to identify electronic documentation items and at least one key value associated with an electronic documentation item. A key value is used to look up a transaction identifier associated with the transaction, and documentation items are indexed according to the key value and transaction identifier. Documentation items are

10 archived in a data storage system or device, and a date and/or time is logged for at least some of the documentation items.
